O&Gmuster solution is operational on the site Laggan and Tormore recently !

Located approximately 125km north-west of the Shetland Islands, the Laggan and Tormore fields represent the future of the UK oil and gas industry

New Shetland Gas Plant (SGP) – O&Gmuster

Both fields lie in an area known generically as West of Shetland – a region geographically closer to the North Atlantic than the North Sea – located on the edge of the UK continental shelf. Here, water depths descend rapidly from an average of 120m to 600m and beyond. It's a uniquely challenging environment in which to operate, but also one with great potential.

The project enabled the implementation of a high availability ACS & POB with our product O & Gmuster , on which provides engineering , procurement , fabrication and on-site assistance for " Laggan Tormorre ".
