O&Gmuster on oil platforms and floatels in Nigeria!

O&Gmuster deployed on 6 platforms and 3 floatels to monitor over 1,000 workers.

As we are writing this article, our electronic mustering system is progressively being installed and commissioned on the 6 platforms and 3 floatels constituting the OFON 2 site, operated by TOTAL E&P Nigeria. Each floatel is equipped with a single compact central system composed of electronic mustering readers and two mustering zones. To ensure interconnection and respect the temporary constraints of floatels we have set up a shared database using a radio network. With over 1,000 crossings on gangways each day we have also equipped all gangways with electronic tracking readers. The personnel can thus be monitored in real time and in any location on site.

O&Gmuster is designed to guarantee the safety of personnel working on industrial sites in harsh environments. Our electronic mustering system facilitates the evacuation in case of an emergency and reduces the evacuation time drastically. The whole evacuation process can be monitored from touchscreen tablets.
